CDH/OPTRAN Version 3.5 Release Note

CDH/OPTRAN Version 3.5

The following new features and enhancements have been added for the CDH/OPTRAN V3.5 release:

- Support of MSC Nastran Version 2014.x
- Autorequest feature has been enhanced to manage ERP and RANDOM case control commands.
- Gnuplot “set style line xx ...” command in the plot config section is now respected. This feature allows the user to better customize the response curves in png and related gnuplot formats. If this setting is used, there should be as many “set style line” settings as there are curves to be plotted. For instance, if the user plots a response and a target, he should put two “set style line xx ...” settings in the plot config section – one for the response and one for the target, in that order. If the user plots baseline plots as well, these are plotted first and the number of “set style line” settings should account for these curves as well.

Error Corrections:

- Error (integer overflow) in handling very large ERP requests for very large models has been fixed.
